Cover Letter: Senior Software Engineer, Backend

Included Health Remote August 26, 2026

Dear Included Health Hiring Team,

Included Health's work building core systems and services aligns directly with my background in Java backend engineering and enterprise backend and integration workflows. I offer more than 10 years of experience designing, modernizing, and supporting scalable software and infrastructure systems in highly regulated environments.

At Citi, I develop Java backend components, REST APIs, integration services, validation logic, data transformations, and server-side processing for enterprise infrastructure platforms. My work spans system design, implementation, testing, deployment, and production support. This cross-layer experience helps me build dependable backend software while considering operational behavior throughout the development lifecycle.

- **Java backend services**, developing Java components, REST APIs, integration services, validation logic, data transformations, and server-side processing for large enterprise infrastructure datasets and distributed workflows.
- **Scalable data processing**, enabled efficient processing of 10,000+ infrastructure records through server-side pagination, filtering, optimized request processing, reusable services, and efficient data-retrieval patterns.
- **Production troubleshooting**, diagnose complex issues spanning Java applications, middleware, networking, certificates, mTLS, authentication, deployment environments, and infrastructure services, then implement corrective and preventive solutions.
- **Secure enterprise workflows**, design processes that transfer configuration and load-balancer information between AVI and NSX-T systems, reducing repetitive data entry and improving request accuracy and operational efficiency.
- **Cross-functional delivery**, partner with application developers, infrastructure engineers, security teams, product owners, architects, and technical leadership throughout requirements, architecture, development, testing, deployment, and production support.

As Included Health expands its integrated platform and builds services that connect complex systems and workflows, I can contribute practical experience developing dependable APIs and integrations, improving large-scale request processing, and resolving production problems across application and infrastructure layers. My approach is to understand service boundaries, data flows, production behavior, and operational risks first, then use root-cause analysis and practical system design to deliver measurable, maintainable improvements.

I welcome the opportunity to bring my Java backend, API integration, performance engineering, and production systems experience to Included Health's engineering team.

Sincerely,
Lavasier Joyner
