Cover Letter: Senior Software Engineer II

Signifyd, United States Remote August 25, 2026

Dear Signifyd Hiring Team,

I'm applying for the Senior Software Engineer II position because Signifyd's work in API-driven commerce, integrations, and real-time transaction decisioning closely matches my Java backend and integration experience. I'm interested in helping the Integrations & Onboarding team build dependable APIs and ingestion services that support retailers through production onboarding.

I bring more than 10 years of experience designing, developing, modernizing, and supporting enterprise software in highly regulated financial-services environments. At Citi, I work across Java applications, REST APIs, middleware, security controls, networking, deployment pipelines, and production systems. This breadth helps me diagnose problems that cross application and infrastructure boundaries.

- **Java backend services:** Develop Java components, APIs, integration services, validation logic, data transformations, and server-side processing for large enterprise infrastructure datasets and distributed workflows.
- **High-volume processing:** Enabled efficient processing of 10,000+ infrastructure records through server-side pagination, filtering, optimized request processing, reusable services, and efficient data-retrieval patterns.
- **Production reliability:** Diagnose complex issues across Java applications, middleware, networking, load balancers, APIs, certificates, mTLS, authentication, deployment environments, and infrastructure services. I perform root-cause analysis and implement corrective and preventive solutions.
- **Secure integrations:** Design workflows that transfer configuration and load-balancer information between AVI and NSX-T processes, reducing repetitive data entry and improving request accuracy.

My approach starts with understanding system requirements, request paths, operational constraints, and failure points. I use practical system design, performance analysis, root-cause investigation, and cross-functional delivery to build services that remain dependable under production conditions. I work with application developers, infrastructure engineers, security teams, product owners, architects, and technical leadership throughout design, development, testing, deployment, and production support.

That approach fits Signifyd's need for API and ingestion systems that process real-time transactions while maintaining reliability and security. I welcome the opportunity to discuss how my Java backend, API integration, performance, and production engineering experience can contribute to Signifyd's Integrations & Onboarding team.

Sincerely,
Lavasier Joyner
