Cover Letter: Senior Software Engineer (Java)

Kunai Remote, United States August 26, 2026

Dear Kunai Hiring Team,

Kunai's focus on engineering-led modernization for major financial institutions aligns with my Java/Tomcat backend experience, regulated financial-services background, and work modernizing enterprise applications across software and infrastructure layers. I offer more than 10 years of experience developing, modernizing, and supporting enterprise systems where scalability, controlled delivery, and production stability are essential.

At Citi, I develop Java backend components, REST APIs, integration services, validation logic, data transformations, and server-side processing for enterprise infrastructure platforms. My responsibilities span system design, implementation, testing, deployment, and production support. I also work across application, middleware, networking, container, and infrastructure layers, which helps me identify technical constraints and address problems that cross traditional team boundaries.

- **Java/Tomcat backend engineering**, developing Java components, REST APIs, integration services, validation logic, data transformations, and server-side processing for large enterprise infrastructure datasets and distributed workflows.
- **Enterprise application modernization**, serve as a primary engineer modernizing a legacy AngularJS load-balancer application to React while retaining and enhancing Java/Tomcat backend services for enterprise deployment.
- **Scalable server-side processing**, enabled efficient processing of 10,000+ infrastructure records through server-side pagination, filtering, optimized request processing, reusable services, and efficient data-retrieval patterns.
- **Performance analysis and remediation**, analyze application and infrastructure behavior to identify bottlenecks affecting data retrieval, request processing, user-interface rendering, deployment workflows, and overall system performance.
- **Controlled software delivery**, build and optimize CI/CD pipelines for automated build, testing, deployment, and promotion across DEV, UAT, and PROD using TeamCity, GitHub, Kubernetes, Red Hat OpenShift, Harness, and Ansible.

For Kunai's modernization work, I would begin by understanding service boundaries, legacy constraints, integration flows, deployment paths, and current performance behavior. I would then use root-cause analysis and practical system design to identify bottlenecks, implement targeted improvements, and deliver changes through controlled enterprise pipelines. My experience partnering with application developers, infrastructure engineers, security teams, product owners, architects, and technical leadership supports the cross-functional delivery required in large financial-services programs.

I welcome the opportunity to bring my Java backend, application-modernization, OpenShift, performance-analysis, and production-engineering experience to Kunai.

Sincerely,
Lavasier Joyner
